

# **Week 3: Exoplanet Interiors and Atmospheres**

# Atmospheres

**Primary** vs. **Secondary**

**Jupiter**

**Saturn**

**Earth**

**Venus**

# Secondary Atmospheres

## Sources

- outgassing (volcanic)
- evaporation & sublimation

## Sinks

- condensation
- thermal escape
- solar wind stripping
- chemical rxns on surface

# Terrestrial Atmospheres

Outgassing

Venus

Earth

Mars

# Atmospheric Escape

average thermal energy > escape velocity

$$v_{atom} \approx \sqrt{\frac{T}{m_{atom}}}$$

$$v_{esc} \approx \sqrt{\frac{M_{planet}}{r_{planet}}}$$

# Detecting Exoplanet Atmospheres

# Planet Composition

- **Density = mass / volume**
- **Volume of sphere =  $\frac{4}{3} \cdot \pi \cdot r^3$**
- **Expressed in  $\text{g/cm}^3$**

# Planet Composition

**Transit  $\rightarrow$  Radius**

**Radial Velocity  $\rightarrow$  Mass**

**DENSITY**

# Planet Composition: Example

Earth Radius:  $6.37 \times 10^8$  cm

Earth Mass:  $5.97 \times 10^{27}$  g

Earth volume =  $(4/3) \cdot \pi \cdot \text{radius}^3$   
 $= 1.08 \times 10^{27}$  cm<sup>3</sup>

Earth density = mass/volume  
 $\sim 5.5$  g/cm<sup>3</sup>

# Planet Composition: Exoplanets

## Composition of Kepler-10b
